Editorial

After the Second World War, the Russians had a military radar station in Crimea working with microwaves in the 3 cm diapason. The workers noticed that their body temperature was higher during the week when they were working with microwaves at the radar station. During the weekend their body temperature was dropping down to normal, but was going up again when they worked with microwaves at the radar station. This is how it was discovered that the microwaves could heat. Based on the thermal effect of the microwaves, the microwaves ovens were later created.

If we use microwaves to cook or warm food and we know that the microwaves have thermal effect, why during the global warming everybody is blaming for the warming only the increased amount of CO₂ in the atmosphere and knowing that the microwaves have warming effect nobody says anything about the warming created by the microwaves we use in: our digital TVs, our cellular phones, our internet, and everything wireless... And while the microwaves in the microwave ovens are screened with a metal

screen, we are not screened in any way from the microwaves of our cellular phones, the internet, the digital TVs, and everything wireless.

I am telling my son to use his cellular phone only on speaker. He should never put it close to his head because the instruction for using microwave oven says “never open the door of the microwave oven when it is still working.” I said to my son: “Having the cellular phone next to your head is like putting your head in the microwave oven when it is still working.” If knowing that microwaves have thermal effect, nobody wants to admit that microwaves could be contributing to the global warming, it is because we cannot imagine our lives without: the cellular phones, without the internet, without the digital TVs and everything wireless – they are such convenience.

In the US only, there are 300 millions of cellular phones, which makes the US third in the world by the number of cellular phones used. This requires a dense set of towers emitting microwaves for cellular phones and internet. And since each company has its own set of towers, these towers

The Global Warming and the Microwave Warming

are denser than what they could be if private companies didn't own them. These private companies don't care how much more is the microwave radiation to which the people are exposed, and how much more warming of the atmosphere these microwaves would create. The towers-antennas pollute not only the atmosphere – they pollute the earth as well. According to nonlinear physics, anti-vortices emit energy. If so, each antenna to emit energy must create an earth anti-vortex, which messes up the earth's regular grid of alternating vortices and anti-vortices.

I have an article published [1], which explains that we didn't create the global warming - we just made it worse. The global warming was a result of increased solar activity caused by the overlapping of two maximum of solar activity – the maximum of the short 11-year cycle of solar activity in year 2020 was coinciding with the maximum of the large cycle of solar activity of 2,562.5 years (according to study of the glaciers) [1]. However, seven planets were aligned on one side of the Sun on December 21, 2020. Their summed up magnetic moments were supposed to disturb the Sun asymmetrically and cause flipping of the magnetic poles of the Sun, which means that the Sun would start spinning in opposite direction and losing energy. This was supposed to end the solar activity and the global warming [1]. If the global warming continues after December 21, 2020, this would allow us to see how much we have contributed to the global warming with our environmental pollutions (including microwave technologies).

Thus, we didn't create the global warming – the coincided two maximum of solar activity did - but now when the solar activity is going down, and the number of microwave towers is going up, we may see the global warming continue. The continuing global warming after December 21, 2020, will give us an idea how much our technologies contributed to the global warming. Expect things to become much worse in the future because some companies like Ligado Network already have the permission to use the earth satellites to beam microwaves to the earth from the space, which is expected to radically increase the microwave intensity and their warming effect. Shouldn't we do our best to stop the beaming of microwave radiation to the Earth from its satellites? The microwave pollution of the Earth from the towers emitting microwaves for our

cellular phones, internet, and TV is more than enough to exterminate us.

When we complain about global warming, we should consider all the factors that might have contributed to it. The raise of carbon dioxide (CO₂) level in the atmosphere caused by our industrialization and use of energy sources that pollute the environment is only one side of the story. Also, 1/ We have ruthlessly destroyed the rainforest and many other forests on Earth, which were the source of oxygen. 2/ We have saturated with warming microwaves our environment, which boosted the global warming. 3/ On the top of everything, when trying to counteract the drought caused by the global warming, the way we found to create artificial rain created more harm. Chemicals are sprayed to create clouds. However, to create rain we shoot the earth ionosphere with a powerful microwave flux to create rain of ions, which in the clouds act as nucleuses of condensation. By shooting on the earth ionosphere, we have depleted the ionosphere. This resulted in decreased atmosphere in thickness and size - the larger opening over the poles led to hotter summers with more melting of the polar ice and colder winters [2].
